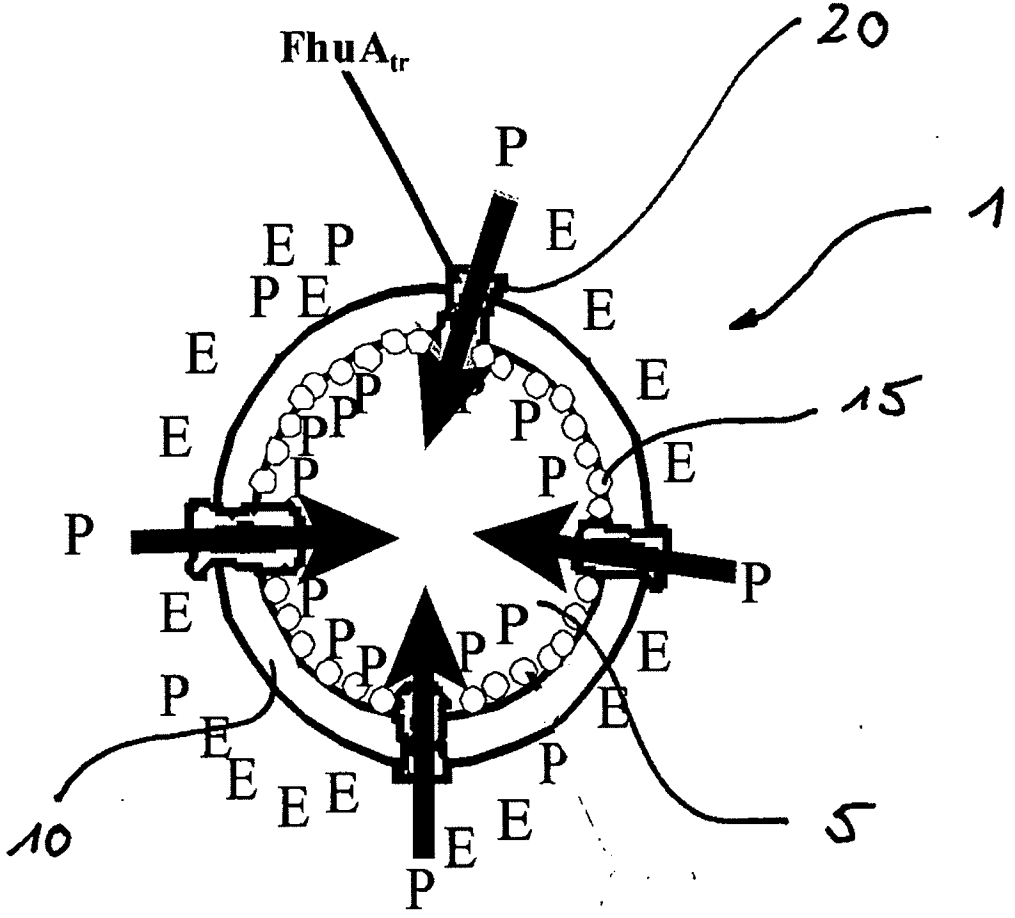
FIG. 1



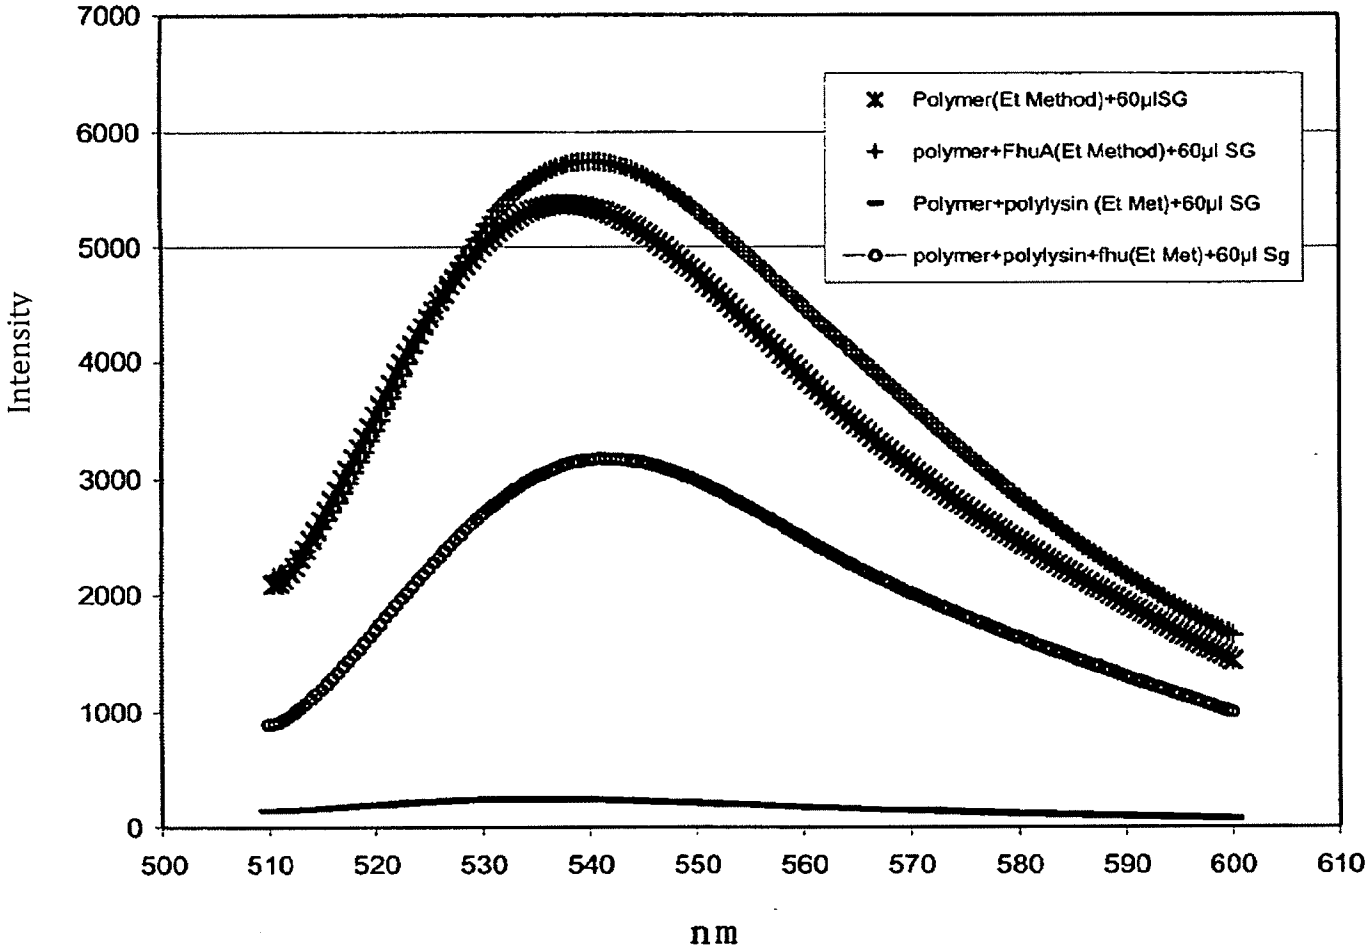


FIG. 2: Fluorescence measurement from 500nm to 610nm after addition of 60 microliters of SYBR Gold (SG) to the vesicles with and without DNA. Vesicles were prepared by the 'ethanol' method (Et Method. Et Met). Cleaning method 1 was used for the separation.

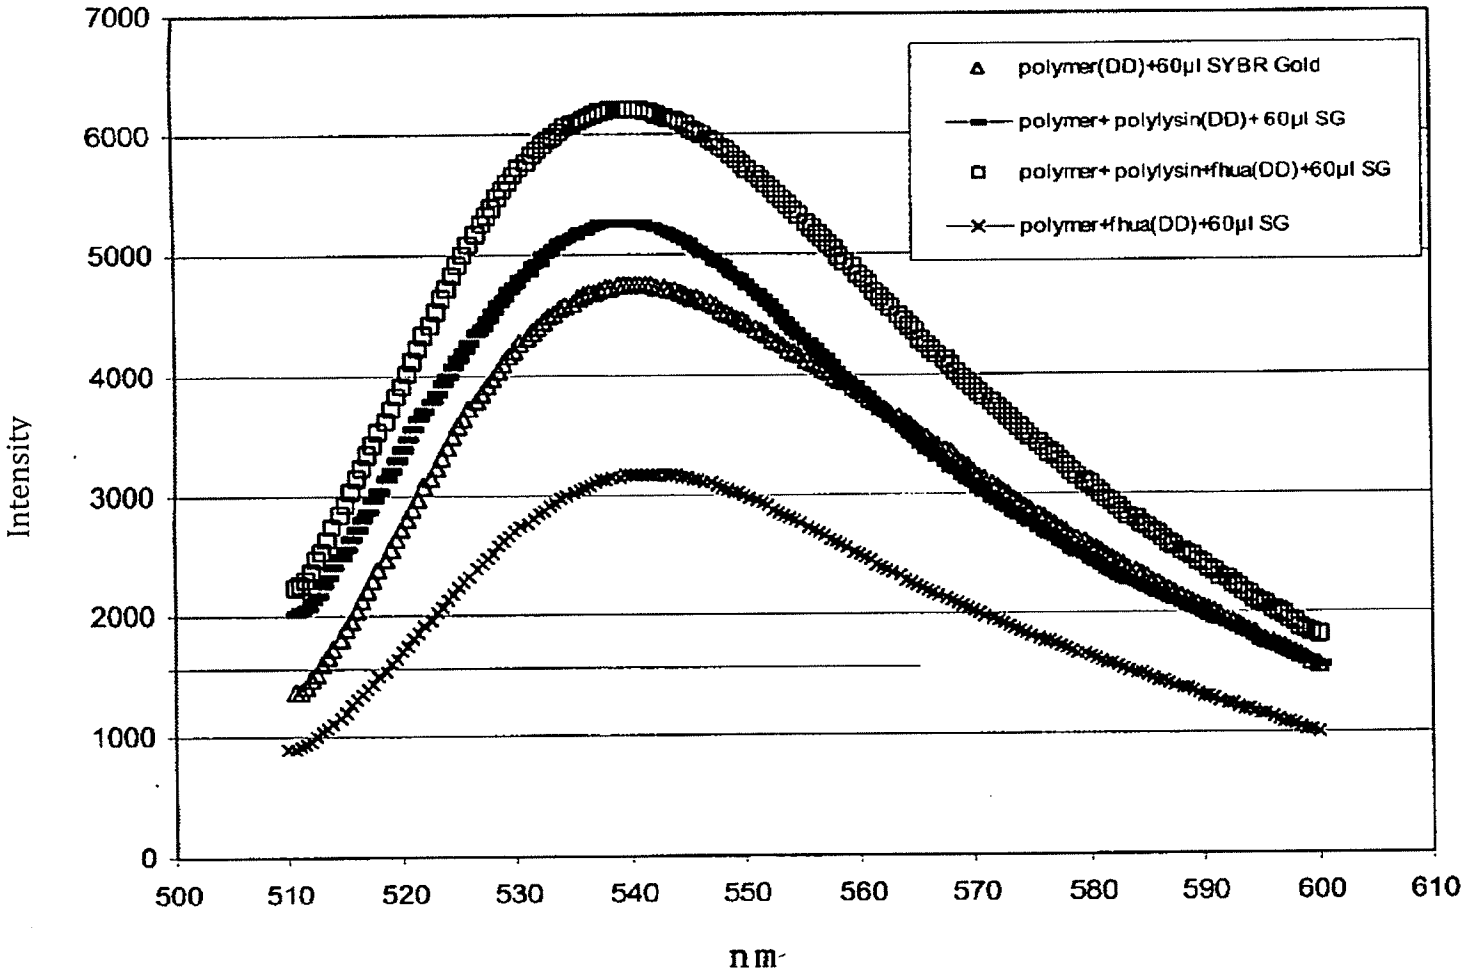

FIG. 3: Fluorescence measurement from 500nm to 610nm after addition of 60 microliters of SYBR Gold (SB) to the vesicles with and without DNA. Vesicles were prepared by the "direct dissolution" method (DD). Cleaning method 1 was used for the separation.

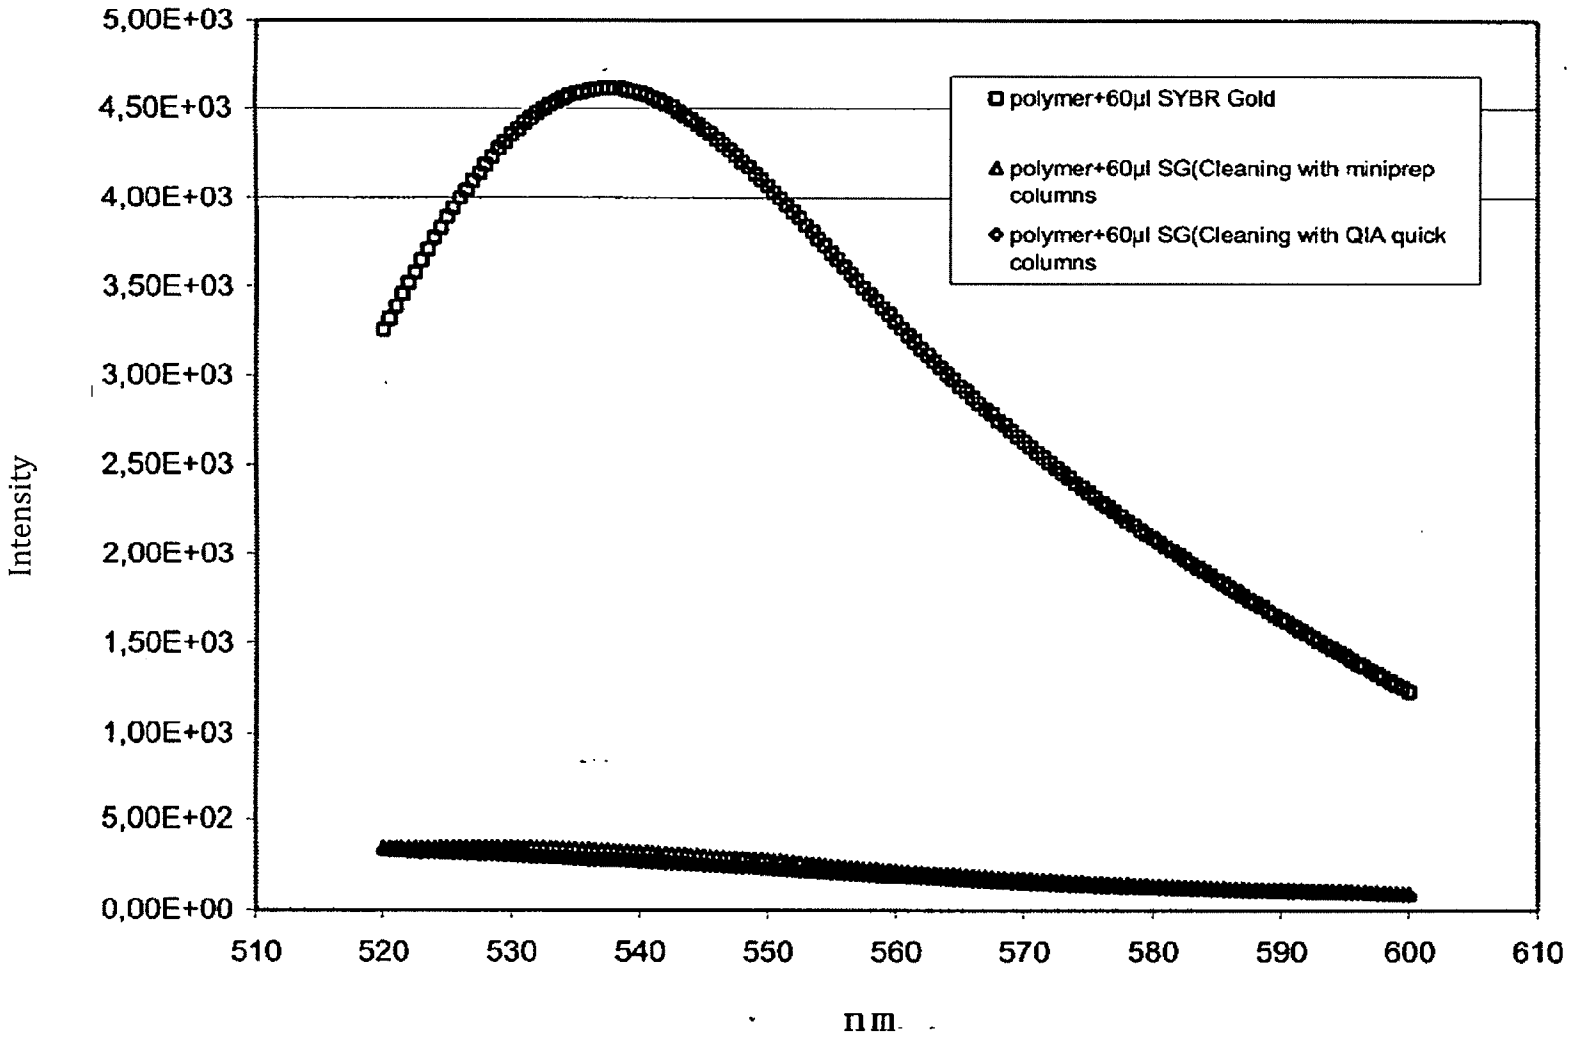

FIG. 4: Fluorescence measurement from 520nm to 610nm after addition of 60 microliters of SYBR Gold (SB) to the vesicles with and without DNA. Vesicles were prepared by the "ethanol" method (DD). Cleaning method 2 was used for the separation.

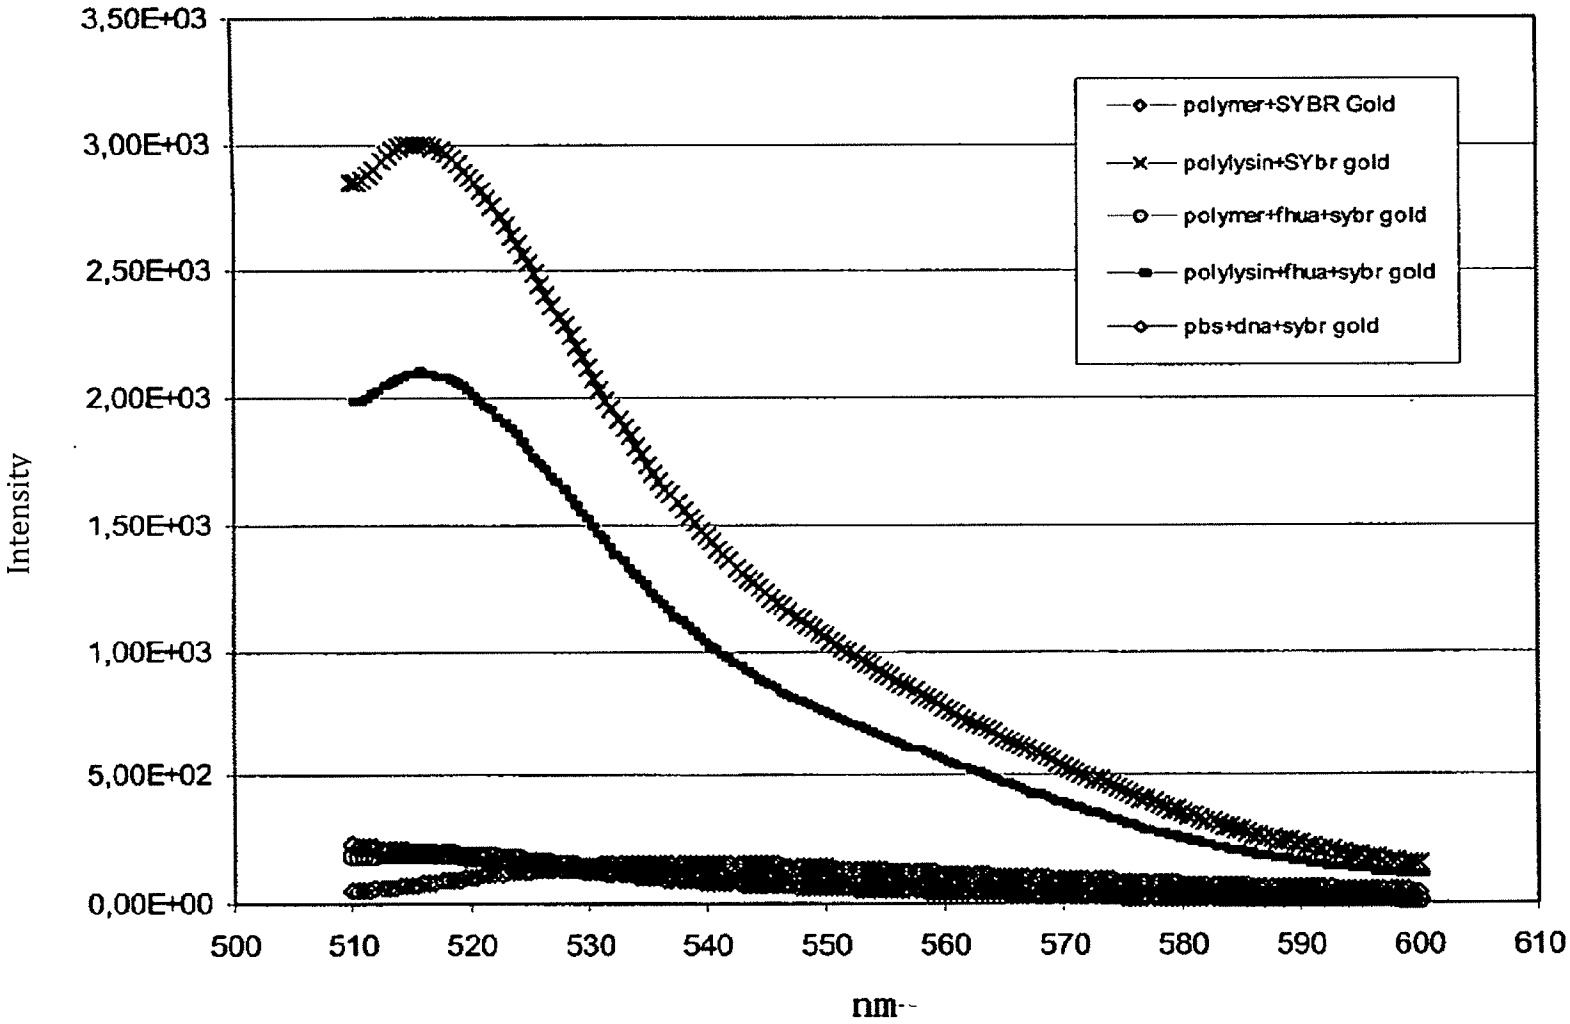

FIG. 5: Fluorescence measurement from 500nm to 610nm after addition of 60 microliters of SYBR Gold (SB) to the vesicles with and without DNA. Vesicles were prepared by the "ethanol" method (DD). Cleaning method 3 was used for the separation.

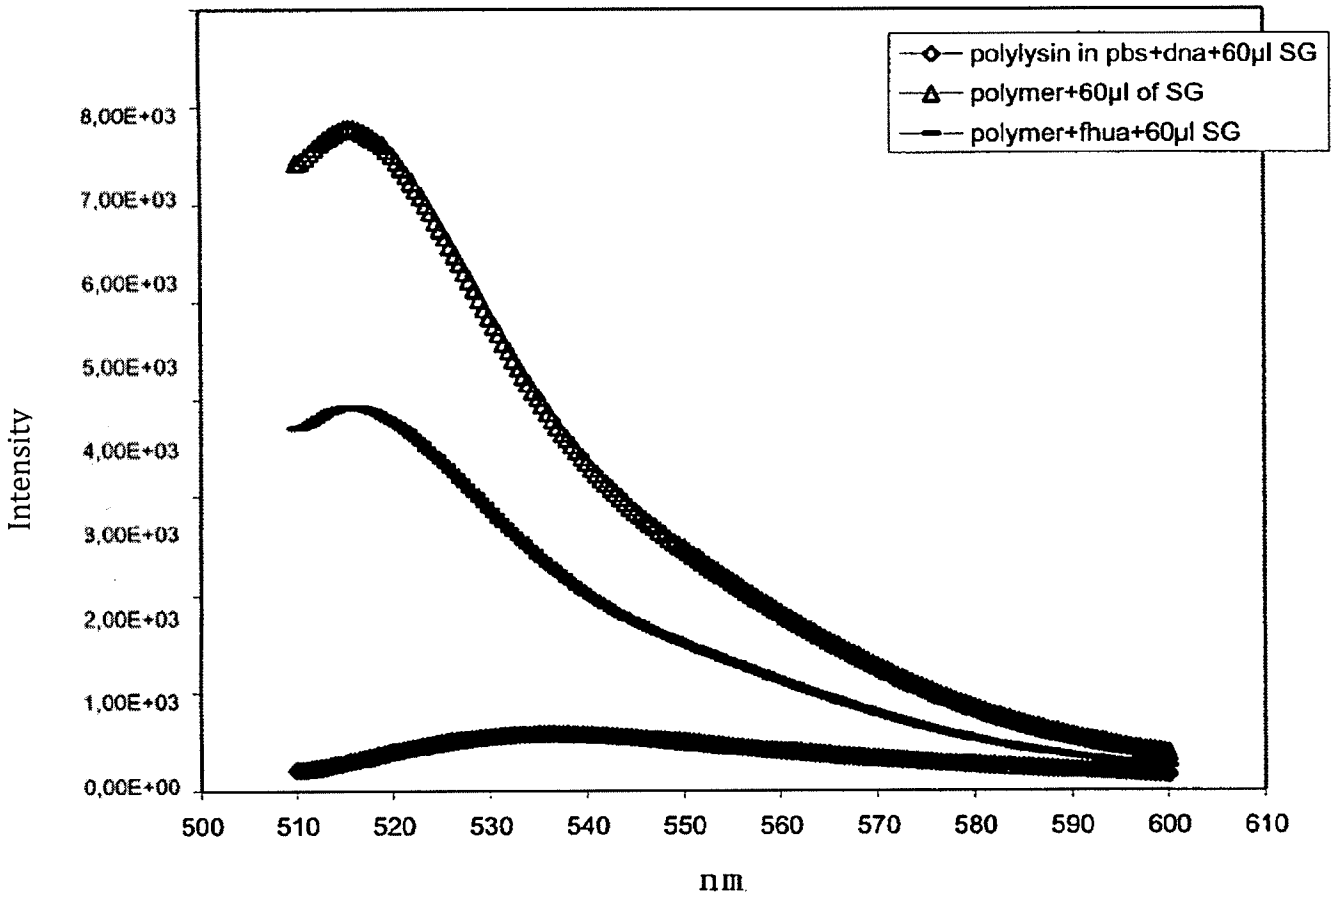

FIG. 6: Fluorescence measurement from 500nm to 610nm after addition of 60 microliters of SYBR Gold (SB) to the vesicles with and without DNA. "Direct dissolution" method)
